

## ON SEQUENCE-COVERING *mssc*-IMAGES OF LOCALLY SEPARABLE METRIC SPACES

Nguyen Van Dung

*Communicated by Miloš Kurilić*

ABSTRACT. We characterize sequence-covering (resp., 1-sequence-covering, 2-sequence-covering) *mssc*-images of locally separable metric spaces by means of  $\sigma$ -locally finite *cs*-networks (resp., *sn*-networks, *so*-networks) consisting of  $\aleph_0$ -spaces (resp., *sn*-second countable spaces, *so*-second countable spaces). As the applications, we get characterizations of certain sequence-covering, quotient *mssc*-images of locally separable metric spaces.

### 1. Introduction

A study of some images of metric spaces under certain mappings is an important task on general topology. In [12], Li characterized sequence-covering (pseudo-sequence-covering) *mssc*-images of metric spaces by means of  $\aleph$ -spaces as follows.

THEOREM 1.1. [12, Theorem 4] *The following are equivalent for a space  $X$ .*

- (1)  $X$  is an  $\aleph$ -space.
- (2)  $X$  is a sequence-covering *mssc*-image of a metric space.
- (3)  $X$  is a pseudo-sequence-covering *mssc*-image of a metric space.

In [18], Lin and Yan characterized compact-covering, quotient  $\pi$ - and *mssc*-images of metric spaces by means of  $g$ -metrizable spaces, and this result has been proved by a quick and systematic proof in [25].

THEOREM 1.2. [18, Corollary 18] *The following are equivalent for a space  $X$ .*

- (1)  $X$  is a  $g$ -metrizable space.
- (2)  $X$  is a compact-covering, quotient compact and *mssc*-image of a metric space.
- (3)  $X$  is a compact-covering, quotient  $\pi$ - and *mssc*-image of a metric space.
- (4)  $X$  is a compact-covering, quotient  $\pi$ - and  $\sigma$ -image of a metric space.

Related to the characterizations of images of metric spaces, many topologists were engaged in characterizing images of locally separable metric spaces, and some noteworthy results have been shown. In [16], Lin, Liu, and Dai characterized quotient  $s$ -images of locally separable metric spaces. After that, Lin and Yan characterized sequence-covering  $s$ -images of locally separable metric spaces [17]; Ikeda, Liu and Tanaka characterized quotient compact images of locally separable metric spaces [11]; Ge characterized pseudo-sequence-covering compact images of locally separable metric spaces [8]; An and Dung characterized quotient  $\pi$ -images of locally separable metric spaces [1]. In general, it is difficult to obtain nice characterizations of images of locally separable metric spaces (under covering-mappings) instead of metric domains.

Take the above into account, note that  $\aleph$ -spaces and  $g$ -metrizable spaces are spaces having certain  $\sigma$ -locally finite networks, the following question arises naturally.

QUESTION. *How are sequence-covering (1-sequence-covering, 2-sequence-covering) mssc-images of locally separable metric spaces characterized by means of  $\sigma$ -locally finite networks?*

In this paper, we characterize sequence-covering (resp., 1-sequence-covering, 2-sequence-covering) mssc-images of locally separable metric spaces by means of  $\sigma$ -locally finite  $cs$ -networks (resp.,  $sn$ -networks,  $so$ -networks) consisting of  $\aleph_0$ -spaces (resp.,  $sn$ -second countable spaces,  $so$ -second countable spaces). As the applications, we get characterizations of certain sequence-covering, quotient mssc-images of locally separable metric spaces. These results make the study of images of locally separable metric spaces more completely.

Throughout this paper, all spaces are regular and  $T_1$ , all mappings are continuous and onto, a convergent sequence includes its limit point, and  $\mathbb{N}$  denotes the set of all natural numbers. Let  $f : X \rightarrow Y$  be a mapping, and  $\mathcal{P}$  be a family of subsets of  $X$ , we denote  $\bigcup \mathcal{P} = \bigcup \{P : P \in \mathcal{P}\}$ ,  $\bigcap \mathcal{P} = \bigcap \{P : P \in \mathcal{P}\}$ , and  $f(\mathcal{P}) = \{f(P) : P \in \mathcal{P}\}$ . We say that a convergent sequence  $\{x_n : n \in \mathbb{N}\} \cup \{x\}$  converging to  $x$  is *eventually* in  $A$  if  $\{x_n : n \geq n_0\} \cup \{x\} \subset A$  for some  $n_0 \in \mathbb{N}$ , and it is *frequently* in  $A$  if  $\{x_{n_k} : k \in \mathbb{N}\} \cup \{x\} \subset A$  for some subsequence  $\{x_{n_k} : k \in \mathbb{N}\}$  of  $\{x_n : n \in \mathbb{N}\}$ .

DEFINITION 1.1. Let  $\mathcal{P}$  be a family of subsets of a space  $X$ .

(1)  $\mathcal{P}$  is a *network* for  $X$  [19] if,  $\mathcal{P} = \bigcup \{\mathcal{P}_x : x \in X\}$ , where  $x \in \bigcap \mathcal{P}_x$ , and if  $x \in U$  with  $U$  open in  $X$ , then there exists  $P \in \mathcal{P}_x$  such that  $x \in P \subset U$  for every  $x \in X$ . Here,  $\mathcal{P}_x$  is a *network* at  $x$  in  $X$ .

(2)  $\mathcal{P}$  is a *cs-network* for  $X$  [10] if, for each convergent sequence  $S$  converging to  $x \in U$  with  $U$  open in  $X$ ,  $S$  is eventually in  $P \subset U$  for some  $P \in \mathcal{P}$ .

(3)  $\mathcal{P}$  is a *cs\*-network* for  $X$  [7] if, for each convergent sequence  $S$  converging to  $x \in U$  with  $U$  open in  $X$ ,  $S$  is frequently in  $P \subset U$  for some  $P \in \mathcal{P}$ .

(4)  $\mathcal{P}$  is a *cfp-network* for  $X$  [26] if, for each compact subset  $H \subset U$  with  $U$  open in  $X$ , there exists a finite subfamily  $\mathcal{F}$  of  $\mathcal{P}$  such that  $H \subset \bigcup \{C_F : F \in \mathcal{F}\} \subset U$ , where  $C_F$  is closed and  $C_F \subset F$  for every  $F \in \mathcal{F}$ .

DEFINITION 1.2. [6] Let  $X$  be a space and  $P$  be a subset of  $X$ .

(1)  $P$  is a *sequential neighborhood* of  $x$  in  $X$ , if whenever  $S$  is a convergent sequence converging to  $x$ , then  $S$  is eventually in  $P$ .

(2)  $P$  is a *sequentially open* subset of  $X$ , if  $P$  is a sequential neighborhood of  $x$  in  $X$  for every  $x \in P$ .

DEFINITION 1.3. Let  $\mathcal{P} = \bigcup\{\mathcal{P}_x : x \in X\}$  be a family of subsets of a space  $X$  satisfying that, for each  $x \in X$ ,  $\mathcal{P}_x$  is a network at  $x$  in  $X$ , and if  $U, V \in \mathcal{P}_x$ , then  $W \subset U \cap V$  for some  $W \in \mathcal{P}_x$ .

(1)  $\mathcal{P}$  is a *weak base* for  $X$  [23], if  $G \subset X$  such that for each  $x \in G$ , there exists  $P \in \mathcal{P}_x$  satisfying  $P \subset G$ , then  $G$  is open in  $X$ . Here,  $\mathcal{P}_x$  is a *weak base* at  $x$  in  $X$ .

(2)  $\mathcal{P}$  is an *sn-network* for  $X$  [15], if each member of  $\mathcal{P}_x$  is a sequential neighborhood of  $x$  in  $X$ . Here,  $\mathcal{P}_x$  is an *sn-network* at  $x$  in  $X$ .

(3)  $\mathcal{P}$  is an *so-network* for  $X$  [15], if each member of  $\mathcal{P}_x$  is sequentially open in  $X$ . Here,  $\mathcal{P}_x$  is an *so-network* at  $x$  in  $X$ .

DEFINITION 1.4. Let  $X$  be a space.

(1)  $X$  is a *cosmic space* [20] (resp.,  $\aleph_0$ -*space* [20], *sn-second countable space* [9], *so-second countable space*, *second countable space* [5],  $\aleph$ -*space* [21], *g-metrizable space* [23]), if  $X$  has a countable network (resp., countable *cs-network*, countable *sn-network*, countable *so-network*, countable base,  $\sigma$ -locally finite *cs-network*,  $\sigma$ -locally finite weak base).

(2)  $X$  is a *sequential space* [6], if each sequentially open subset of  $X$  is open.

REMARK 1.1. [17] (1) For a space, weak base  $\Rightarrow$  *sn-network*  $\Rightarrow$  *cs-network*.

(2) An *sn-network* for a sequential space is a weak base.

DEFINITION 1.5. Let  $f : X \rightarrow Y$  be a mapping.

(1)  $f$  is an *mssc-mapping* [14], if  $X$  is a subspace of the product space  $\prod_{n \in \mathbb{N}} X_n$  of a family  $\{X_n : n \in \mathbb{N}\}$  of metric spaces, and for each  $y \in Y$ , there exists a sequence  $\{V_{y,n} : n \in \mathbb{N}\}$  of open neighborhoods of  $y$  in  $Y$  such that each  $\overline{p_n(f^{-1}(V_{y,n}))}$  is a compact subset of  $X_n$ , where  $p_n : \prod_{i \in \mathbb{N}} X_i \rightarrow X_n$  is the projection.

(2)  $f$  is an *1-sequence-covering* mapping [15] if, for each  $y \in Y$ , there exists  $x_y \in f^{-1}(y)$  such that whenever  $\{y_n : n \in \mathbb{N}\}$  is a sequence converging to  $y$  in  $Y$  there exists a sequence  $\{x_n : n \in \mathbb{N}\}$  converging to  $x_y$  in  $X$  with each  $x_n \in f^{-1}(y_n)$ .

(3)  $f$  is a *2-sequence-covering* mapping [15] if, for each  $y \in Y$ ,  $x_y \in f^{-1}(y)$ , and sequence  $\{y_n : n \in \mathbb{N}\}$  converging to  $y$  in  $Y$ , there exists a sequence  $\{x_n : n \in \mathbb{N}\}$  converging to  $x_y$  in  $X$  with each  $x_n \in f^{-1}(y_n)$ .

(4)  $f$  is a *sequence-covering* mapping [22] if, for each convergent sequence  $S$  of  $Y$ , there exists a convergent sequence  $L$  of  $X$  such that  $f(L) = S$ . Note that a sequence-covering mapping is a *strong sequence-covering* mapping in the sense of [12].

(5)  $f$  is a *pseudo-sequence-covering* mapping [11] if, for each convergent sequence  $S$  of  $Y$ , there exists a compact subset  $K$  of  $X$  such that  $f(K) = S$ .

(6)  $f$  is a *sequentially-quotient* mapping [3] if, for each convergent sequence  $S$  of  $Y$ , there exists a convergent sequence  $L$  of  $X$  so that  $f(L)$  is a subsequence of  $S$ .

(7)  $f$  is a *compact-covering* mapping [20] if, for each compact subset  $K$  of  $Y$ , there exists a compact subset  $L$  of  $X$  such that  $f(L) = K$ .

(8)  $f$  is a  $\pi$ -*mapping* [2], if for each  $y \in Y$  and for each neighborhood  $U$  of  $y$  in  $Y$ ,  $d(f^{-1}(y), X - f^{-1}(U)) > 0$ , where  $X$  is a metric space with a metric  $d$ .

(9)  $f$  is a  $\sigma$ -*mapping* [18], if there exists a base  $\mathcal{B}$  of  $X$  such that  $f(\mathcal{B})$  is a  $\sigma$ -locally finite family in  $Y$ .

DEFINITION 1.6. [4] A space  $X$  is *sequentially separable*, if  $X$  has a countable subset  $D$  such that for each  $x \in X$ , there exists a sequence  $\{x_n : n \in \mathbb{N}\}$  in  $D$  converging to  $x$ . Here, the subset  $D$  is a *sequentially dense* subset of  $X$ .

For undefined terms, refer to [5] and [24].

## 2. Results

First, we characterize sequence-covering mssc-images of locally separable metric spaces by means of  $\sigma$ -locally finite *cs*-networks.

THEOREM 2.1. *The following are equivalent for a space  $X$ .*

- (1)  $X$  is a sequence-covering mssc-image of a locally separable metric space.
- (2)  $X$  has a  $\sigma$ -locally finite *cs*-network consisting of cosmic spaces.
- (3)  $X$  has a  $\sigma$ -locally finite *cs*-network consisting of  $\aleph_0$ -spaces.

PROOF. (1) $\Rightarrow$ (2). Let  $f : M \rightarrow X$  be a sequence-covering mssc-mapping from a locally separable metric space  $M$  onto  $X$ , and  $\{X_n : n \in \mathbb{N}\}$  be the family of metric spaces satisfying that  $M$  is a subspace of  $\prod_{n \in \mathbb{N}} X_n$ , and for each  $x \in X$ , there exists a sequence  $\{V_{x,n} : n \in \mathbb{N}\}$  of open neighborhoods of  $x$  in  $X$  such that each  $\overline{p_n(f^{-1}(V_{x,n}))}$  is a compact subset of  $X_n$ , where  $p_n : \prod_{i \in \mathbb{N}} X_i \rightarrow X_n$  is the projection. Since  $M$  is locally separable metric,  $M = \bigoplus_{\lambda \in \Lambda} M_\lambda$ , where each  $M_\lambda$  is a separable metric space by [5, 4.4.F]. Since each  $X_n$  is a metric space,  $X_n$  has a  $\sigma$ -locally finite base  $\mathcal{C}_n = \bigcup \{\mathcal{C}_{n,i} : i \in \mathbb{N}\}$ , where each  $\mathcal{C}_{n,i}$  is locally finite. Assume, if necessary, that  $\mathcal{C}_{n,i} \subset \mathcal{C}_{n,i+1}$  for every  $i \in \mathbb{N}$ . For each  $n \in \mathbb{N}$ , set

$$\mathcal{B}_n = \left\{ M \cap \bigcap_{i \leq n} p_i^{-1}(C_i) : \begin{array}{l} C_i \in \bigcup_{j \leq n} \mathcal{C}_{i,j}, i \leq n, \\ M \cap \bigcap_{i \leq n} p_i^{-1}(C_i) \subset M_\lambda \text{ for some } \lambda \in \Lambda \end{array} \right\},$$

set  $\mathcal{P}_n = f(\mathcal{B}_n)$ , and set  $\mathcal{B} = \bigcup \{\mathcal{B}_n : n \in \mathbb{N}\}$ ,  $\mathcal{P} = \bigcup \{\mathcal{P}_n : n \in \mathbb{N}\}$ . Then  $\mathcal{B}$  is a base for  $M$  consisting of separable subsets. Assume, if necessary, that  $\mathcal{B}$  is closed under finite intersections. We shall show that  $\mathcal{P}$  is a  $\sigma$ -locally finite *cs*-network for  $X$  consisting of cosmic spaces by the following facts (a), (b), and (c).

(a)  $\mathcal{P}$  is a *cs*-network for  $X$ .

Let  $S$  be a convergent sequence being eventually in  $U$  with  $U$  open in  $X$ . Since  $f$  is sequence-covering, there exists a convergent sequence  $L$  in  $M$  such that

$f(L) = S$ . Since  $L$  is eventually in  $B \subset f^{-1}(U)$  for some  $B \in \mathcal{B}$ ,  $S$  is eventually in  $f(B) \subset U$ . It implies that  $S$  is eventually in  $P \subset U$  with  $P = f(B) \in \mathcal{P}$ . Therefore,  $\mathcal{P}$  is a *cs*-network for  $X$ .

(b)  $\mathcal{P}$  is  $\sigma$ -locally finite.

For each  $x \in X$  and  $n \in \mathbb{N}$ , set  $V_x = \bigcap_{i \leq n} V_{x,i}$ , then  $V_x$  is an open neighborhood of  $x$  in  $X$ . For each  $i \in \mathbb{N}$ , since  $\overline{p_i(f^{-1}(V_{x,i}))}$  is a compact subset of  $X_i$  and  $\mathcal{C}_{i,j}$  is locally finite,  $p_i(f^{-1}(V_{x,i}))$  meets only finitely many members of  $\mathcal{C}_{i,j}$  for every  $j \in \mathbb{N}$ . Then  $f^{-1}(V_{x,i})$  meets only finitely many members of  $\{p_i^{-1}(C_i) : C_i \in \bigcup_{j \leq n} \mathcal{C}_{i,j}\}$ . Therefore,  $f^{-1}(V_x)$  meets only finitely many members of  $\{\bigcap_{i \leq n} p_i^{-1}(C_i) : C_i \in \bigcup_{j \leq n} \mathcal{C}_{i,j}, i \leq n\}$ . It implies that  $f^{-1}(V_x)$  meets only finitely many members of  $\mathcal{B}_n$ . Hence  $V_x$  meets only finitely many members of  $f(\mathcal{B}_n)$ , i.e.,  $\mathcal{P}_n$  is locally finite. It follows that  $\mathcal{P}$  is  $\sigma$ -locally finite.

(c) Each  $P \in \mathcal{P}$  is a cosmic space.

Set  $P = f(B)$  for some  $B \in \mathcal{B}$ . Since  $B$  is separable,  $P$  is cosmic.

(2)  $\Rightarrow$  (3). Let  $\mathcal{P} = \bigcup\{\mathcal{P}_n : n \in \mathbb{N}\}$  be a  $\sigma$ -locally finite *cs*-network for  $X$  consisting of cosmic spaces. Every locally finite family in a Lindelöf space is countable. Hence for each  $P \in \mathcal{P}$ ,  $\{P \cap P' : P' \in \mathcal{P}\}$  is countable, and obviously it is a *cs*-network for  $P$ .

(3)  $\Rightarrow$  (1). Let  $\mathcal{P} = \bigcup\{\mathcal{P}_n : n \in \mathbb{N}\}$  be a  $\sigma$ -locally finite *cs*-network for  $X$  consisting of  $\aleph_0$ -spaces, where each  $\mathcal{P}_n = \{P_{\alpha_n} : \alpha_n \in A_n\}$  is a locally finite family. For each  $n \in \mathbb{N}$ , since each  $P_{\alpha_n}$  is an  $\aleph_0$ -space,  $P_{\alpha_n}$  has a countable *cs*-network  $\mathcal{P}_{\alpha_n} = \{P_{\alpha_n,i} : i \geq n\}$ . For each  $i \geq n$ , set

$$\mathcal{Q}_{\alpha_n,i} = \{P_{\alpha_n}\} \cup \{P_{\alpha_n,j} : n \leq j \leq i\} = \{Q_\beta : \beta \in B_{\alpha_n,i}\},$$

where  $B_{\alpha_n,i}$  is finite, and set

$$\mathcal{Q}_i = \{X\} \cup \left( \bigcup \{ \mathcal{Q}_{\alpha_j,i} : \alpha_j \in A_j, j \leq i \} \right) = \{Q_\beta : \beta \in B_i\},$$

where  $B_i = \{\beta_0\} \cup \left( \bigcup \{ B_{\alpha_j,i} : \alpha_j \in A_j, j \leq i \} \right)$  with  $Q_{\beta_0} = X$ . Since each  $\mathcal{P}_i$  is locally finite and each  $\mathcal{Q}_{\alpha_j,i}$  is finite,  $\mathcal{Q}_i$  is locally finite. Endow  $B_i$  with the discrete topology, then  $B_i$  is a metric space. Set

$$M = \left\{ b = (\beta_i) \in \prod_{i \in \mathbb{N}} B_i : \text{there exists } n \in \mathbb{N} \text{ and } \alpha_n \in A_n \text{ such that} \right. \\ \left. \begin{aligned} & Q_{\beta_i} = X \text{ if } i < n, Q_{\beta_i} \in \mathcal{Q}_{\alpha_n,i} \text{ if } i \geq n, \text{ and} \\ & \{Q_{\beta_i} : i \geq n\} \text{ forms a network at a point } x_b \text{ in } P_{\alpha_n} \end{aligned} \right\}.$$

Then  $M$ , which is a subspace of the product space  $\prod_{i \in \mathbb{N}} B_i$ , is a metric space. Since  $X$  is  $T_1$  and regular,  $x_b$  is unique for every  $b \in M$ . We define  $f : M \rightarrow X$  by  $f(b) = x_b$  for every  $b \in M$ .

(a)  $f$  is onto.

For each  $x \in X$ , there exists  $n \in \mathbb{N}$  and  $\alpha_n \in A_n$  such that  $x \in P_{\alpha_n}$ . Since  $\mathcal{P}_{\alpha_n}$  is a countable *cs*-network for  $P_{\alpha_n}$ ,  $(\mathcal{P}_{\alpha_n})_x = \{Q_\beta \in \mathcal{P}_{\alpha_n} : x \in Q_\beta\}$  is a countable network at  $x$  in  $P_{\alpha_n}$ . We may assume that  $(\mathcal{P}_{\alpha_n})_x = \{P_{x,j} : j \in \mathbb{N}\}$ , where  $P_{x,j} \in \mathcal{Q}_{\alpha_n,i(j)}$  with some  $i(j) \in \mathbb{N}$  satisfying  $i(j) < i(j+1)$ . For each  $i \in \mathbb{N}$ , take  $Q_{\beta_i}$  as follows.

(i)  $i < n$ :  $Q_{\beta_i} = X$ ,

(ii)  $i \geq n$ :  $Q_{\beta_i} = P_{x,j}$  if  $i = i(j)$  for some  $j \in \mathbb{N}$ , and otherwise,  $Q_{\beta_i} = P_{\alpha_n}$ .

Then  $\{Q_{\beta_i} : i \geq n\} - \{P_{\alpha_n}\} = (\mathcal{P}_{\alpha_n})_x - \{P_{\alpha_n}\}$ . Therefore,  $\{Q_{\beta_i} : i \geq n\}$  forms a network at  $x$  in  $P_{\alpha_n}$ . It implies that  $b = (\beta_i) \in M$  satisfying  $x = f(b)$ , i.e.,  $f$  is onto.

(b)  $f$  is continuous.

For each  $b = (\beta_i) \in M$  and  $x = f(b) \in U$  with  $U$  open in  $X$ . Then  $x = f(b) \in Q_{\beta_k} \subset U$  for some  $k \in \mathbb{N}$ . Set  $U_b = \{c = (\gamma_i) \in M : \gamma_k = \beta_k\}$ . Then  $U_b$  is open in  $M$ , and  $b \in U_b$ . For each  $c \in U_b$ , we find  $f(c) \in Q_{\gamma_k} = Q_{\beta_k} \subset U$ . It implies that  $f(U_b) \subset U$ , i.e.,  $f$  is continuous.

(c)  $M$  is locally separable.

Let  $b = (\beta_i) \in M$ . Then there exists  $n \in \mathbb{N}$  and  $\alpha_n \in A_n$  such that  $Q_{\beta_i} = X$  if  $i < n$ ,  $Q_{\beta_i} \in \mathcal{Q}_{\alpha_n,i}$  if  $i \geq n$ , and  $\{Q_{\beta_i} : i \geq n\}$  forms a network at a point  $x_b$  in  $P_{\alpha_n}$ . Set  $M_b = \{c = (\gamma_i) \in M : \gamma_n = \beta_n\}$ . Then  $M_b$  is open in  $M$ , and  $b \in M_b$ . For each  $c = (\gamma_i) \in M_b$ , there exists  $m \in \mathbb{N}$  and  $\alpha_m \in A_m$  such that  $Q_{\gamma_i} = X$  if  $i < m$ ,  $Q_{\gamma_i} \in \mathcal{Q}_{\alpha_m,i}$  if  $i \geq m$ , and  $\{Q_{\gamma_i} : i \geq m\}$  forms a network at a point  $x_c$  in  $P_{\alpha_m}$ . It follows from  $Q_{\gamma_n} = Q_{\beta_n}$  that  $P_{\alpha_m} \cap P_{\alpha_n} \neq \emptyset$ . Since  $P_{\alpha_n}$  is an  $\aleph_0$ -space and  $\mathcal{P}_m$  is locally finite,  $C_m = \{\alpha_m \in A_m : P_{\alpha_m} \cap P_{\alpha_n} \neq \emptyset\}$  is countable for every  $m \in \mathbb{N}$ . Then  $E_i = \{\beta_0\} \cup (\bigcup \{B_{\alpha_j,i} : \alpha_j \in C_j, j \leq i\})$  is countable. It implies that  $\{\beta_1\} \times \cdots \times \{\beta_{n-1}\} \times \prod_{i \geq n} E_i$  is hereditarily separable. Since  $M_b \subset \{\beta_1\} \times \cdots \times \{\beta_{n-1}\} \times \prod_{i \geq n} E_i$ ,  $M_b$  is separable. Therefore,  $M$  is locally separable.

(d)  $f$  is an mssc-mapping.

For each  $x \in X$  and each  $i \in \mathbb{N}$ , since  $\mathcal{P}_i$  is locally finite, there exists an open neighborhood  $V_{x,i}$  of  $x$  in  $X$  such that  $D_i = \{\alpha_i \in A_i : P_{\alpha_i} \cap V_{x,i} \neq \emptyset\}$  is finite. Then  $F_i = \{\beta_0\} \cup (\bigcup \{B_{\alpha_j,i} : \alpha_j \in D_j, j \leq i\})$  is finite. Since  $p_i(f^{-1}(V_{x,i})) \subset F_i$ ,  $p_i(f^{-1}(V_{x,i}))$  is compact. It implies that  $f$  is an mssc-mapping.

(e)  $f$  is sequence-covering.

For each convergent sequence  $S$  in  $X$ , since  $\mathcal{P}$  is a  $\sigma$ -locally finite  $cs$ -network for  $X$ , there exists  $n \in \mathbb{N}$  and  $\alpha_n \in A_n$  such that  $S$  is eventually in  $P_{\alpha_n} \in \mathcal{P}_n$ . Then  $L_{\alpha_n} = S \cap P_{\alpha_n}$  is a convergent sequence in  $P_{\alpha_n}$ . For each  $i \geq n$ , we find that  $\bigcup \{Q_{\alpha_n,i} : i \geq n\}$  is a  $\sigma$ -locally finite  $cs$ -network for  $P_{\alpha_n}$  satisfying  $P_{\alpha_n} \in \mathcal{Q}_{\alpha_n,i} \subset \mathcal{Q}_{\alpha_n,i+1}$ . It follows from the proof (3) $\Rightarrow$ (2) of [13, Theorem 5.1] that there exists a convergent sequence  $H_{\alpha_n}$  in  $M_{\alpha_n}$  such that  $f_{\alpha_n}(H_{\alpha_n}) = L_{\alpha_n}$ , where

$$M_{\alpha_n} = \left\{ c = (\gamma_i)_{i \geq n} \in \prod_{i \geq n} B_{\alpha_n,i} : \{Q_{\gamma_i} : i \geq n\} \text{ forms a network at a point } x_c \text{ in } P_{\alpha_n} \right\},$$

and  $f_{\alpha_n} : M_{\alpha_n} \rightarrow P_{\alpha_n}$  defined by  $f_{\alpha_n}(c) = x_c$  for every  $c \in M_{\alpha_n}$ . For each  $c = (\gamma_i)_{i \geq n} \in H_{\alpha_n}$ , set  $b_c = (\beta_i)_{i \in \mathbb{N}}$ , where  $Q_{\beta_i} = X$  if  $i < n$  and  $\beta_i = \gamma_i$  if  $i \geq n$ , and set  $H = \{b_c : c \in H_{\alpha_n}\}$ . Then  $H$  is a convergent sequence in  $M$  and  $f(H) = L_{\alpha_n}$ . Since  $S$  is eventually in  $P_{\alpha_n}$ ,  $S - P_{\alpha_n}$  is finite. Then  $S - P_{\alpha_n} = f(F)$  with some finite subset  $F$  of  $M$ . Set  $L = H \cup F$ , then  $L$  is a convergent sequence in  $M$  satisfying  $f(L) = S$ . It implies that  $f$  is sequence-covering.  $\square$

REMARK 2.1. The argument for *cs*-networks in the proof(2)  $\Rightarrow$ (3) of Theorem 2.1 can not apply to *cs*\*-networks or *cfp*-networks.

COROLLARY 2.1. *The following are equivalent for a space  $X$ .*

- (1)  *$X$  is a sequence-covering, quotient mssc-image of a locally separable metric space.*
- (2)  *$X$  is a sequential space having a  $\sigma$ -locally finite *cs*-network consisting of cosmic spaces.*
- (3)  *$X$  is a sequential space having a  $\sigma$ -locally finite *cs*-network consisting of  $\aleph_0$ -spaces.*

PROOF. (1)  $\Rightarrow$  (2). Since  $X$  is a quotient image of a locally separable metric space,  $X$  is a sequential space by [6, Proposition 1.2]. Then  $X$  is a sequential space having a  $\sigma$ -locally finite *cs*-network consisting of cosmic spaces by Theorem 2.1.

(2)  $\Rightarrow$  (3). As in the proof(2)  $\Rightarrow$ (3) of Theorem 2.1.

(3)  $\Rightarrow$ (1). It follows from Theorem 2.1 that  $X$  is a sequence-covering mssc-image of a locally separable metric space under some mapping  $f$ . Since  $f$  is a sequence-covering mapping onto a sequential space,  $f$  is a quotient mapping by [17, Lemma 3.5]. It implies that  $X$  is a sequence-covering, quotient mssc-image of a locally separable metric space.  $\square$

Next, we characterize 1-sequence-covering mssc-images of locally separable metric spaces by means of  $\sigma$ -locally finite *sn*-networks.

THEOREM 2.2. *The following are equivalent for a space  $X$ .*

- (1)  *$X$  is an 1-sequence-covering mssc-image of a locally separable metric space.*
- (2)  *$X$  has a  $\sigma$ -locally finite *sn*-network consisting of cosmic spaces.*
- (3)  *$X$  has a  $\sigma$ -locally finite *sn*-network consisting of *sn*-second countable spaces.*

PROOF. (1)  $\Rightarrow$  (2). Let  $f : M \rightarrow X$  be an 1-sequence-covering mssc-mapping from a locally separable metric space  $M$  onto  $X$ . For each  $x \in X$ , let  $a_x \in f^{-1}(x)$  satisfying that whenever  $\{x_n : n \in \mathbb{N}\}$  is a sequence converging to  $x$  in  $X$  there exists a sequence  $\{a_n : n \in \mathbb{N}\}$  converging to  $a_x$  in  $M$  with each  $a_n \in f^{-1}(x_n)$ . By using notations in the proof (1)  $\Rightarrow$  (2) of Theorem 2.1 again, let  $\mathcal{Q}_x = \{P \in \mathcal{P} : P = f(B) \text{ with } a_x \in B \in \mathcal{B}\}$ , and let  $\mathcal{Q} = \bigcup\{\mathcal{Q}_x : x \in X\}$ . We shall prove that  $\mathcal{Q}$  is a  $\sigma$ -locally finite *sn*-network for  $X$  consisting of cosmic spaces by the following facts (a), (b), (c) for every  $x \in X$ , and (d), (e).

(a)  $\mathcal{Q}_x$  is a network at  $x$  in  $X$ .

It is clear that  $x \in \bigcap \mathcal{Q}_x$ . Let  $x \in U$  with  $U$  open in  $X$ , then  $a_x \in f^{-1}(U)$ . Since  $\mathcal{B}$  is a base for  $M$ ,  $a_x \in B \subset f^{-1}(U)$  for some  $B \in \mathcal{B}$ . Set  $Q = f(B)$ , then  $Q \in \mathcal{Q}_x$  and  $x \in Q \subset U$ . It implies that  $\mathcal{Q}_x$  is a network at  $x$  in  $X$ .

(b) If  $Q_1, Q_2 \in \mathcal{Q}_x$ , then  $Q \subset Q_1 \cap Q_2$  for some  $Q \in \mathcal{Q}_x$ .

Set  $Q_1 = f(B_1), Q_2 = f(B_2)$ , where  $B_1, B_2 \in \mathcal{B}$  with  $a_x \in B_1$  and  $a_x \in B_2$ . Since  $\mathcal{B}$  is a base for  $M$ ,  $a_x \in B \subset B_1 \cap B_2$  for some  $B \in \mathcal{B}$ . Set  $Q = f(B)$ , then  $Q \in \mathcal{Q}_x$  and  $Q \subset Q_1 \cap Q_2$ .

(c) Each  $Q \in \mathcal{Q}_x$  is a sequential neighborhood of  $x$ .

Set  $Q = f(B)$  with  $a_x \in B \in \mathcal{B}$ . For each convergent sequence  $S$  converging to  $x$ , there exists a convergent sequence  $L$  converging to  $a_x$  in  $M$  such that  $f(L) = S$ . Since  $L$  is eventually in  $B$ ,  $S$  is eventually in  $Q$ . It implies that  $Q$  is a sequential neighborhood of  $x$ .

(d)  $\mathcal{Q}$  is  $\sigma$ -locally finite.

Since  $\mathcal{Q} \subset \mathcal{P}$  and  $\mathcal{P}$  is  $\sigma$ -locally finite,  $\mathcal{Q}$  is  $\sigma$ -locally finite.

(e) Each  $Q \in \mathcal{Q}$  is a cosmic space.

Set  $Q = f(B)$  for some  $B \in \mathcal{B}$ . Since  $B$  is separable,  $Q$  is cosmic.

(2)  $\Rightarrow$  (3). As in the proof (2)  $\Rightarrow$  (3) of Theorem 2.1.

(3)  $\Rightarrow$  (1). Let  $\mathcal{P} = \bigcup\{\mathcal{P}_n : n \in \mathbb{N}\}$  be a  $\sigma$ -locally finite  $sn$ -network for  $X$  consisting of  $\aleph_0$ -spaces. By using notations and arguments in the proof (3)  $\Rightarrow$  (1) of Theorem 2.1 again, since each  $sn$ -network is also a  $cs$ -network, it suffices to prove that the mapping  $f$  is 1-sequence-covering.

For each  $x \in X$ , since  $\mathcal{P}$  is a  $\sigma$ -locally finite  $sn$ -network for  $X$ , there exists  $n \in \mathbb{N}$  and  $\alpha_n \in A_n$  such that  $P_{\alpha_n}$  is a sequential neighborhood of  $x$ . Then  $\bigcup\{Q_{\alpha_n, i} : i \geq n\}$  is a  $\sigma$ -locally finite  $sn$ -network for  $P_{\alpha_n}$ . It implies that  $f_{\alpha_n}$  is 1-sequence-covering by [13, Theorem 2.1]. Hence, there exists  $c_x = (\gamma_{x, i})_{i \geq n} \in f_{\alpha_n}^{-1}(x)$  such that whenever  $\{x_m : m \in \mathbb{N}\}$  is a sequence converging to  $x$  in  $P_{\alpha_n}$  there exists a sequence  $\{c_m : m \in \mathbb{N}\}$  converging to  $c_x$  in  $M_{\alpha_n}$  with each  $c_m \in f_{\alpha_n}^{-1}(x_m)$ . Set  $b_x = (\beta_{x, i})$ , where  $Q_{\beta_{x, i}} = X$  if  $i < n$  and  $\beta_{x, i} = \gamma_{x, i}$  if  $i \geq n$ , then  $b_x \in f^{-1}(x)$ . Let  $\{y_m : m \in \mathbb{N}\}$  be a sequence in  $X$  converging to  $x$ . Since  $P_{\alpha_n}$  is a sequential neighborhood of  $x$ , there exists  $m_0 \in \mathbb{N}$  such that  $\{y_m : m \geq m_0\} \subset P_{\alpha_n}$  is a sequence converging to  $x$  in  $P_{\alpha_n}$ . Then there exists a sequence  $\{c_m : m \geq m_0\}$  in  $M_{\alpha_n}$  converging to  $c_x$  and  $c_m \in f_{\alpha_n}^{-1}(y_m)$  for each  $m \geq m_0$ . For each  $c_m = (\gamma_{m, i})_{i \geq n}$ , set  $b_m = (\beta_{m, i})$ , where  $Q_{\beta_{m, i}} = X$  if  $i < n$  and  $\beta_{m, i} = \gamma_{m, i}$  if  $i \geq n$ . Then  $b_m \in M$  and  $f(b_m) = y_m$  for each  $m \geq m_0$ . For each  $m < m_0$ , take some  $b_m \in f^{-1}(y_m)$ . Then  $\{b_m : m \in \mathbb{N}\}$  is a sequence in  $M$  converging to  $b_x$  and  $b_m \in f^{-1}(y_m)$  for each  $m \in \mathbb{N}$ . It implies that  $f$  is 1-sequence-covering.  $\square$

**COROLLARY 2.2.** *The following are equivalent for a space  $X$ .*

- (1)  $X$  is an 1-sequence-covering, quotient mssc-image of a locally separable metric space.
- (2)  $X$  has a  $\sigma$ -locally finite weak base consisting of cosmic spaces.
- (3)  $X$  has a  $\sigma$ -locally finite weak base consisting of  $sn$ -second countable spaces.

**PROOF.** (1)  $\Rightarrow$  (2). Since  $X$  is a quotient image of a locally separable metric space,  $X$  is a sequential space by [6, Proposition 1.2]. Then  $X$  is a sequential space having a  $\sigma$ -locally finite  $sn$ -network  $\mathcal{P}$  consisting of cosmic spaces by Theorem 2.2. It follows from Remark 1.1 that  $\mathcal{P}$  is a weak base for  $X$ . Therefore,  $X$  has a  $\sigma$ -locally finite weak base consisting of cosmic spaces.

(2)  $\Rightarrow$  (3). Since  $X$  has a  $\sigma$ -locally finite weak base,  $X$  is a sequential space. It follows from Theorem 2.2 that  $X$  is a sequential space having a  $\sigma$ -locally finite  $sn$ -network  $\mathcal{P}$  consisting of  $sn$ -second countable spaces. By Remark 1.1,  $\mathcal{P}$  is a weak base for  $X$ . It implies that  $X$  has a  $\sigma$ -locally finite weak base consisting of  $sn$ -second countable spaces.

(3)  $\Rightarrow$  (1). It follows from Theorem 2.2 that  $X$  is an 1-sequence-covering mssc-image of a locally separable metric space under some mapping  $f$ . Since  $X$  has a  $\sigma$ -locally finite weak base,  $X$  is a sequential space. Then  $f$  is an 1-sequence-covering mapping onto a sequential space, and so  $f$  is a quotient mapping by [17, Lemma 3.5]. It implies that  $X$  is an 1-sequence-covering, quotient mssc-image of a locally separable metric space.  $\square$

REMARK 2.2. We can replace “*cosmic spaces*” in Theorem 2.2 and Corollary 2.2 by “ $\aleph_0$ -*spaces*”.

In the following, we characterize 2-sequence-covering mssc-images of locally separable metric spaces by means of  $\sigma$ -locally finite *so*-networks.

THEOREM 2.3. *The following are equivalent for a space  $X$ .*

- (1)  $X$  is a 2-sequence-covering mssc-image of a locally separable metric space.
- (2)  $X$  has a  $\sigma$ -locally finite *so*-network consisting of cosmic spaces.
- (3)  $X$  has a  $\sigma$ -locally finite *so*-network consisting of *so*-second countable spaces.

PROOF. (1)  $\Rightarrow$  (2). Let  $f : M \rightarrow X$  be a 2-sequence-covering mssc-mapping from a locally separable metric space  $M$  onto  $X$ . For each  $x \in X$ , by using notations in the proof(1)  $\Rightarrow$  (2) of Theorem 2.1 again, let  $\mathcal{B}_x = \{B \in \mathcal{B} : f^{-1}(x) \cap B \neq \emptyset\}$ , and let  $\mathcal{R}_x$  be the family of all finite intersections of members of  $f(\mathcal{B}_x)$ . We shall prove that  $\mathcal{R} = \bigcup\{\mathcal{R}_x : x \in X\}$  is a  $\sigma$ -locally finite *so*-network for  $X$  consisting of cosmic spaces by the following facts (a), (b), (c) for every  $x \in X$  and (d), (e).

(a)  $\mathcal{R}_x$  is a network at  $x$  in  $X$ .

This is obvious because  $\mathcal{B}_x$  is a base for  $f^{-1}(x)$ .

(b) If  $R_1, R_2 \in \mathcal{R}_x$ , then  $R \subset R_1 \cap R_2$  for some  $R \in \mathcal{R}_x$ .

This is obvious by choosing  $R = R_1 \cap R_2$ .

(c) Each  $R \in \mathcal{R}_x$  is sequentially open.

Let  $B \in \mathcal{B}_x$ ,  $y \in f(B)$ , and  $S$  be a convergent sequence converging to  $y$ . Since  $y \in f(B)$ ,  $f^{-1}(y) \cap B \neq \emptyset$ . Take some  $a_y \in f^{-1}(y) \cap B$ . Then there exists a convergent sequence  $L$  converging to  $a_y$  in  $M$  such that  $f(L) = S$ . Since  $L$  is eventually in  $B$ ,  $S$  is eventually in  $f(B)$ . It implies that  $f(B)$  is sequentially open, i.e., every member of  $f(\mathcal{B}_x)$  is sequentially open. Because  $R$  is some finite intersection of members of  $f(\mathcal{B}_x)$ , we find that  $R$  is sequentially open.

(d)  $\mathcal{R}$  is  $\sigma$ -locally finite.

Since  $\bigcup\{f(\mathcal{B}_x) : x \in X\} \subset \mathcal{P}$  and  $\mathcal{P}$  is  $\sigma$ -locally finite,  $\bigcup\{f(\mathcal{B}_x) : x \in X\}$  is  $\sigma$ -locally finite. It implies that  $\mathcal{R}$  is  $\sigma$ -locally finite.

(e) Each  $R \in \mathcal{R}$  is a cosmic space.

For each  $B \in \mathcal{B}_x$ , since  $B$  is separable,  $f(B)$  is cosmic, i.e., every member of  $f(\mathcal{B}_x)$  is cosmic. It implies that  $R$  is cosmic.

(2)  $\Rightarrow$  (3). As in the proof(2)  $\Rightarrow$ (3) of Theorem 2.1.

(3)  $\Rightarrow$  (1). Let  $\mathcal{P} = \bigcup\{\mathcal{P}_n : n \in \mathbb{N}\}$  be a  $\sigma$ -locally finite *so*-network for  $X$  consisting of  $\aleph_0$ -spaces. By using notations and arguments in the proof (3)  $\Rightarrow$  (1) of Theorem 2.1 again, since each *so*-network is also a *cs*-network, it suffices to prove that the mapping  $f$  is 2-sequence-covering.

For each  $x \in X$  and each  $b_x \in f^{-1}(x)$ , let  $b_x = (\beta_{x,i})$ . Then there exists some  $n \in \mathbb{N}$  and  $\alpha_n \in A_n$  such that  $Q_{\beta_{x,i}} = X$  if  $i < n$ ,  $Q_{\beta_{x,i}} \in \mathcal{Q}_{\alpha_n,i}$  if  $i \geq n$ , and  $\{Q_{\beta_{x,i}} : i \geq n\}$  forms a network at  $x$  in  $P_{\alpha_n}$ . Set  $c_x = (\beta_{x,i})_{i \geq n}$ , then  $c_x \in f_{\alpha_n}^{-1}(x)$ . Since  $\{\mathcal{Q}_{\alpha_n,i} : i \geq n\}$  is a  $\sigma$ -locally finite *so*-network for  $P_{\alpha_n}$ ,  $f_{\alpha_n}$  is a 2-sequence-covering by [13, Theorem 3.1]. Let  $\{x_m : m \in \mathbb{N}\}$  be a sequence converging to  $x$  in  $X$ . Since  $P_{\alpha_n}$  is sequentially open, there exists  $m_0 \in \mathbb{N}$  such that  $\{x_m : m \geq m_0\}$  is a sequence converging to  $x$  in  $P_{\alpha_n}$ . Then there exists a sequence  $\{c_m : m \geq m_0\}$  in  $M_{\alpha_n}$  converging to  $c_x$  and  $c_m \in f_{\alpha_n}^{-1}(x_m)$  for each  $m \geq m_0$ . For each  $c_m = (\gamma_{m,i})_{i \geq n}$ , set  $b_m = (\beta_{m,i})$ , where  $Q_{\beta_{m,i}} = X$  if  $i < n$ , and  $\beta_{m,i} = \gamma_{m,i}$  if  $i \geq n$ . Then  $b_m \in M$  and  $f(b_m) = x_m$  for each  $m \geq m_0$ . For each  $m < m_0$ , take some  $b_m \in f^{-1}(x_m)$ . Then  $\{b_m : m \in \mathbb{N}\}$  is a sequence in  $M$  converging to  $b_x$  and  $b_m \in f^{-1}(x_m)$  for each  $m \in \mathbb{N}$ . It implies that  $f$  is 2-sequence-covering.  $\square$

**COROLLARY 2.3.** *The following are equivalent for a space  $X$ .*

- (1)  $X$  is a 2-sequence-covering, quotient mssc-image of a locally separable metric space.
- (2)  $X$  has a  $\sigma$ -locally finite base consisting of cosmic spaces.
- (3)  $X$  has a  $\sigma$ -locally finite base consisting of second countable spaces.

**PROOF.** (1)  $\Rightarrow$  (2). Since  $X$  is a quotient image of a locally separable metric space,  $X$  is a sequential space by [6, Proposition 1.2]. It follows from Theorem 2.3 that  $X$  is a sequential space having a  $\sigma$ -locally finite *so*-network  $\mathcal{P}$  consisting of cosmic spaces. For each  $P \in \mathcal{P}$ , since  $X$  is sequential and  $P$  is sequential open,  $P$  is open in  $X$ . Hence  $\mathcal{P}$  is a  $\sigma$ -locally finite base for  $X$  consisting of cosmic spaces.

(2)  $\Rightarrow$  (3). It follows from Theorem 2.3 that  $X$  has a  $\sigma$ -locally finite *so*-network  $\mathcal{P}$  consisting of *so*-second countable spaces. Since  $X$  has a  $\sigma$ -locally finite base,  $X$  is sequential. It implies that every  $P \in \mathcal{P}$  is open. Then  $\mathcal{P}$  is a  $\sigma$ -locally finite base consisting of *so*-second countable spaces.

Let  $P \in \mathcal{P}$  and  $\mathcal{Q}$  be a countable *so*-network for  $P$ . Since  $P$  is open,  $P$  is a sequential space by [6, Proposition 1.9]. Then every  $Q \in \mathcal{Q}$  is open in  $P$ . Hence  $\mathcal{Q}$  is a countable base for  $P$ . It implies that  $P$  is a second countable space.

By the above,  $X$  has a  $\sigma$ -locally finite base consisting of second countable spaces.

(3)  $\Rightarrow$  (1). It follows from Theorem 2.3 that  $X$  is a 2-sequence-covering mssc-image of a locally separable metric space under some mapping  $f$ . Since  $X$  has a  $\sigma$ -locally finite base,  $X$  is sequential. Then  $f$  is a 2-sequence-covering mapping onto a sequential space, and so  $f$  is a quotient mapping by [17, Lemma 3.5]. It implies that  $X$  is a 2-sequence-covering, quotient mssc-image of a locally separable metric space.  $\square$

**REMARK 2.3.** We can replace “*cosmic spaces*” in Theorem 2.3 and Corollary 2.3 by “ $\aleph_0$ -spaces”, or “*sn-second countable spaces*”.
