Abstract

A norm inequality is proved for elements of a star algebra so that the algebra is noncommutative. In particular, a relation between maximal and minimal extensions of regular norm on a C^* -algebra is established.

2000 Mathematics Subject Classification: 46H05, 46J10, 47A50.

Key words: W^* -algebras, C^* -algebras, Self-adjoint elements (operators), Maximal and minimal extensions of a regular norm, Furuta type inequalities.

Let H be a Hilbert space and $B(H)$ be the algebra of all bounded linear operators on H . A subset of $B(H)$ is a W^* -algebra on H if X is a C^* -algebra which is closed in the weak operator topology, see [1]. Also, a W^* -algebra is a C^* -subalgebra of $B(H)$ which is weakly closed. In particular, a W^* -algebra is an algebra of operators. We note that a C^* -algebra acting on H is commutative if and only if zero is the only nilpotent element of the algebra.

Let X be a W^* -algebra and X_{SA} be the set of self-adjoint elements of X , that is if $T \in S(X) \implies T = T^*$, where T^* is the adjoint of T . Here we prove the following theorem.

Theorem 1. *A unital W^* -algebra X of operators is noncommutative if $\forall A, B \in X_{SA}$,*

$$\|A\| = 1 = \|B\| \implies \|A + B\| > 1 + \|AB\|.$$

Proof. Since X is noncommutative, there exists an operator T in X such that $T^2 = 0$. Suppose X_1 is the range of T and X_2 is the orthogonal complement of X_1 . Then $H = X_1 \oplus X_2$. Let S be an operator with $\|S\| = 1$. Then

$$T = \begin{pmatrix} 0 & S \\ 0 & 0 \end{pmatrix} \quad \text{and} \quad T^* = \begin{pmatrix} 0 & 0 \\ S^* & 0 \end{pmatrix}.$$

We use these representations for T and T^* to define the operators A and B as follows: For $\sigma_1 > 0$, $\sigma_2 > 0$ and $\sigma_1 + \sigma_2 = 1$, we have

$$A = \begin{pmatrix} S S^* & 0 \\ 0 & 0 \end{pmatrix} = T T^*,$$

$$B = \begin{pmatrix} \sigma_1 SS^* & \sigma_2 S \\ \sigma_2 S^* & \sigma_1 S^* S \end{pmatrix} = \sigma_1 (TT^* + T^*T) + \sigma_2 (T + T^*).$$

Clearly, $A = A^*$, $B = B^*$ and $A, B \in X$. Next, we consider the following two cases.

Case 1. Let $\sigma_1 = \sigma_2 = \frac{1}{2}$ and

$$B = \frac{1}{2} \begin{pmatrix} SS^* & S \\ S^* & S^* S \end{pmatrix} = \frac{1}{2} (TT^* + T^*T + T + T^*).$$

It is not difficult to see that $\|A\| = 1$ and $\|B\| \leq 1$. To obtain $\|B\| \geq 1$, let $\|S\| = 1$ then $\exists a_n \in X \ni \|a_n\| = 1$. Also,

$$\begin{aligned} \|SS^*a_n - a_n\|^2 &= \|SS^*a_n\|^2 - 2\|S^*a_n\|^2 + \|a_n\|^2 \\ &\leq 2(\|a_n\|^2 - \|S^*a_n\|^2) \end{aligned}$$

and if $\|S^*a_n\| \rightarrow 1$ then $SS^*a_n - a_n \rightarrow 0$. Further, $(Bb - b) \rightarrow 0$, where $b = (a_n + S^*a_n)$ and hence, $\|B\| \geq 1$, which concludes that $\|B\| = 1$.

Let

$$AB = \frac{1}{2} \begin{pmatrix} SS^* & S \\ S^* & S^* S \end{pmatrix} \quad \text{and}$$

$$A + B = \begin{pmatrix} SS^* + \frac{SS^*}{2} & \frac{S}{2} \\ \frac{S^*}{2} & \frac{S^* S}{2} \end{pmatrix} = \frac{1}{2} (TT^* + T^*T + T + T^*).$$

Choose a_n as above and $b_n = \frac{S^*a_n}{(2\mu-1)}$, where $\mu > 1$. Let

$$\mu_1 = \sigma_1 + \frac{1}{2} + \left(\sigma_2 + \frac{1}{4} \right)^{\frac{1}{2}}$$

so that it satisfies the equation

$$(\mu_1 - \sigma_1 - 1)(\mu_1 - \sigma_1) = \sigma_2^2.$$

Then

$$[(A + B)(a_n + b_n) - \mu(a_n + b_n)] \rightarrow 0$$

and $\|A + B\| \geq \mu > 1$. If we choose σ_1 and σ_2 so that

$$\sigma_1 + \frac{1}{2} + \left(\sigma_2 + \frac{1}{4}\right)^{\frac{1}{2}} > 1 + (\sigma_1^2 + \sigma_2^2)^{\frac{1}{2}},$$

then we have

$$\|A + B\| > 1 + \|AB\|.$$

For example, it is sufficient to take $\sigma_1 = \frac{2}{3}$ and $\sigma_2 = \frac{1}{3}$. We note that $\sigma_1 > \sigma_2$. If $\sigma_1 < \sigma_2$ then the above inequality fails. Since $\mu > 1 + \sqrt{2}\sigma_1$ the proof in this case is complete.

Case 2. Let $\sigma_1 \neq \sigma_2$. Then $\|AB\| \leq a_0$, (by mimicking the proof of Case 1), where

$$a_0 = \sup \{ \sigma_1 \|a\| + \sigma_2 \|b\| : \|a\|^2 + \|b\|^2 = 1 \} = \sqrt{\sigma_1^2 + \sigma_2^2}.$$

Let $b_n(\mu_1 - \sigma_1) = \sigma_2 S^* a_n$, where μ_1 depends on σ_1 and σ_2 . Then $\|A + B\| \geq \mu_1$ and one can have the following form of μ_1 , that is, $2\mu_1 = (2\sigma_1 + 1) + \sqrt{1 + \sigma_1^2}$. Hence, $\mu_1 > 1 + a_0$ and this concludes the proof of the theorem.

Remark 1. If X is commutative then for $A, B \in X_{SA}$ with $\|A\| = 1 = \|B\|$, we have $0 \leq I - B - A + AB$, where I is the identity operator. Thus $\|A + B\| \leq 1 + \|AB\|$.

Let $0 < p, q, r$ be real numbers such that $q(2r + 1) \geq (2r + p)$ and $q \geq 1$. If two bounded linear operators $A, B \in B(H)$ on a Hilbert space H satisfy $0 \leq B \leq A$ then $(B^r A^p B^r)^{\frac{1}{q}} \geq B^{\frac{p}{q}} B^{\frac{2r}{q}}$. This inequality is called the Furuta inequality and can be found in [3]. Recently, Kotaro and others in [6] have extended this inequality in a unital hermitian Banach $*$ -algebras with continuous involution. We give a slightly different version of these inequalities in the following corollary.

Corollary 2. Suppose that X_{C^*} is a C^* -algebra acting on H . Let λ, μ and σ be three real numbers with $\sigma > 0, \lambda > 0$. Then there exists operators T_1, T_2 and T_3 in $X \ni: \lambda T_1 + \mu T_2 + \sigma T_3 \geq 0 \iff \lambda \sigma \geq \mu^2$.

Proof. We recall that an operator $O \in B(H)$ is positive if $\langle Oh, h \rangle \geq 0$ for every vector h . Using the techniques of Theorem 1, the following operators belong to X_{C^*} . That is,

$$T_1 = \begin{pmatrix} SS^* & 0 \\ 0 & 0 \end{pmatrix}, \quad T_2 = \begin{pmatrix} 0 & \sqrt{SS^*}S \\ S^*\sqrt{SS^*} & 0 \end{pmatrix}, \quad \text{and}$$

$$T_3 = \begin{pmatrix} 0 & 0 \\ 0 & S^*S \end{pmatrix}$$

are in X_{C^*} . In this case we have

$$\lambda T_1 + \mu T_2 + \sigma T_3 = \begin{pmatrix} \lambda SS^* & \mu \sqrt{SS^*}S \\ \mu S^*\sqrt{SS^*} & \sigma S^*S \end{pmatrix}.$$

Let $\lambda T_1 + \mu T_2 + \sigma T_3 = \Lambda$. Then we observe that the determinant of Λ is zero if $\lambda\sigma = \mu^2$. If $\varepsilon < 0$ and $h \in H$, then we have

$$\begin{aligned} \|(\Lambda - \varepsilon)h\|^2 &= \|\Lambda h\|^2 - 2\varepsilon \langle \Lambda h, h \rangle + \varepsilon^2 \|h\|^2 \\ &\geq -2\varepsilon \langle \Lambda h, h \rangle + \varepsilon^2 \|h\|^2 \\ &\geq +\varepsilon^2 \|h\|^2. \end{aligned}$$

Thus $\varepsilon \notin SP_{ap}(\Lambda)$, the approximate point spectrum of Λ . This means that $(\Lambda - \varepsilon)$ is left invertible. Since $(\Lambda - \varepsilon)$ is hermitian, it must also be right invertible. That is, $\varepsilon \notin SP(\Lambda)$ and so $\Lambda \geq 0 \iff \lambda\sigma \geq \mu^2$.

Alternatively, for $a \in X_1$ and $b \in X_2$, we have

$$\langle \Lambda(a+b), (a+b) \rangle = \left\| \sqrt{\sigma}Sb + \mu\sqrt{\frac{SS^*}{\sigma}}a \right\|^2 + \left(\lambda - \frac{\mu^2}{\sigma} \right) \|S^*a\|^2.$$

Since $a \in X_1$, therefore

$$\exists b_n \in X_2 \ni: \sqrt{\sigma}(Sb_n) + \mu\sqrt{\frac{SS^*}{\sigma}}a \rightarrow 0 \implies \Lambda \geq 0 \iff \lambda - \frac{\mu^2}{\sigma} \geq 0.$$

Hence the proof of the corollary is complete. \square

Remark 2. By reducing the matrix Λ into a product of three matrices the above corollary can also be proved. That is, $\Lambda = L^*DL$, where

$$L = \begin{pmatrix} I & W \\ 0 & I \end{pmatrix} \quad \text{and} \quad W = \frac{\mu}{\sigma} \sqrt{SS^*} S \sqrt{S^*S}.$$

By the partial commutation relation, we have

$$\sqrt{SS^*}S = S\sqrt{S^*S}$$

and hence

$$D = \begin{pmatrix} \left(\lambda - \frac{\mu^2}{\sigma}\right) SS^* & 0 \\ 0 & \sigma S^*S \end{pmatrix}.$$

Under the above assumption about σ and S^*S , the Sylvester type test applies. That is, Λ is positive (semi definite) if and only if $\sigma > 0$ and $\lambda - \frac{\mu^2}{\sigma} \geq 0$.

Let $A, B > 0$ be invertible operators on H . In this case a Furuta type inequality is obtainable by replacing 1 with 0 in the original Furuta inequality in Remark 1. In fact, we have

$$A^{2r} \geq (A^r B^p A^r)^{\frac{2r}{(2r+p)}}.$$

Also, if $A \geq B \geq 0$, $\exists: A > 0$, then for each $\alpha \in [0, 1]$ and $p \geq 1$ we have

$$\left\{ A^{\frac{r}{2}} \left(A^{-\frac{\alpha}{2}} B^{\alpha} A^{-\frac{\alpha}{2}} \right)^s A^{\frac{r}{2}} \right\}^{\frac{(1+r-\alpha)}{[(p-\alpha)s+r]}} \leq A^{(1+r-\alpha)} \quad \text{for } s \geq 1 \text{ and } r \geq \alpha.$$

For more details, see [3]. The following examples give an application of these inequalities in case of C^* -algebras.

Example 1. Let X be a commutative C^* -algebra acting on H . If we take

$$A = 6T_1 + 0T_2 + 3T_3 \quad \text{and} \\ B = 3T_1 + 2T_2 + T_3$$

Page 8 of 12

then

$$A - B = 3T_1 - 2T_2 + T_3$$

and by the Corollary 2 we have $A - B \geq 0$. We further note that A^2 is not greater than or equal to B^2 , since for $b \in X_2$,

$$\langle (A^2 - B^2) b, b \rangle + \langle (S^*S)^2 b, b \rangle = 0.$$

Example 2. Let

$$A = 2T_1, \quad B = T_1 + T_2 + T_3 \quad \text{and} \\ C = 4T_1 + T_2 + T_3.$$

Then $A \geq 0$ and $B+C \geq 0$. Further, by the Corollary 2, we have $B+C-A \geq 0$. Let $\Psi \leq B$ and $\Phi \leq C$, where $A = \Psi + \Phi$. Then $\Psi \leq A$. Hence, from Corollary 2, for $a \in X_1$ and $b \in X_2$, we have

$$\langle (T_1 + T_2 + T_3)(a + b), (a + b) \rangle = \left\| \sqrt{SS^*}a + Sb \right\|^2.$$

Also, $b_n \in X_2 \implies \Psi = 0$, because $(Sb_n + \sqrt{SS^*}a) \rightarrow 0$. Thus

$$A = \Phi = 2T_1 \leq 4T_1 + T_2 + T_3.$$

Example 3. Let

$$A = \frac{1}{3}T_1, \quad B = T_1 + T_2 + T_3 \quad \text{and} \\ C = 4T_1 + 2T_2 + T_3.$$

Page 9 of 12

Then $A \geq 0$ and $B+C \geq 0$. Next, by Corollary 2, we get $B+C-A \geq 0$. Now by Example 2 it follows that $A = \Phi = \frac{1}{3}T_1 \leq C$. This contradicts Corollary 2, since for $(C - A)$, $\lambda\sigma < \mu^2$.

Remark 3. The algebra norm $\|\cdot\|$ on a non-unital Banach algebra \mathfrak{J} can be extended to an algebra norm on the unitization $\mathfrak{J}^+ = Ce + \mathfrak{J}$, (where e is the unit in the algebra) in many ways. In particular, the following two norms,

$$l_1 - \text{norm} = \|(\lambda)e + a\|_1 = |\lambda| + \|a\|$$

and the operator norm,

$$\begin{aligned} & \|(\lambda)e + a\|_{OP} \\ &= \sup \{ \|(\lambda)b + ab\|, \|(\lambda)b + ba\|; b \in \mathfrak{J}, \|b\| \leq 1 \}, \lambda \in C, a \in \mathfrak{J} \end{aligned}$$

are the maximal and the minimal extensions of the original norm respectively, if it is a regular norm, that is,

$$\|a\| = \sup \{ \|ab\|, \|ba\|; b \in \mathfrak{J}, \|b\| \leq 1 \},$$

see [4]. The unitization \mathfrak{J}^+ is complete under both $\|\cdot\|_1$ and $\|\cdot\|_{OP}$, so by the two norm lemma, [2, II, 2.5] these two norms are equivalent. If \mathfrak{J} is a C^* -algebra, $a \in \mathfrak{J}$ is self-adjoint, and λ is complex, then $\|(\lambda)e + a\|_1 \leq 3\|(\lambda)e + a\|_{OP}$. So far the constant 3 is the best possible in this case.

Recently, in [5], we extended the above result to locally m -convex algebras. Now we prove the following corollary.

Page 10 of 12

Corollary 3. *If is a commutative non-unital C^* -algebra $A, B \in Y_{SA}$ with $\|A\| = 1 = \|B\|$, and λ is complex, then*

$$\|(\lambda I + \Psi)\|_1 \leq \lambda_0 + 3 \|\Phi\|_{OP},$$

where $\lambda_0 > 0$, $\Psi = A + B$, and $\Phi = AB$.

Proof. Since

$$\|(\lambda I + A + B)\|_1 \leq 3 \|(\lambda I + A + B)\|_{OP},$$

we have

$$\frac{1}{3} \|(\lambda I + A + B)\|_1 \leq |\lambda| + \|(A + B)\|_{OP} \implies \|(\lambda I + \Psi)\|_1 \leq \lambda_0 + 3 \|\Phi\|_{OP},$$

where $\lambda_0 = 3(|\lambda| + 1) > 0$. This concludes the proof of the corollary. \square

Remark 4. $\|(\lambda i + \Psi)\|_{OP} \leq \frac{\lambda_0}{3} + \|\Phi\|_{OP}.$
