
ELSE - EL Locus Solus' Externals

for the Pure Data programming language

Version: 1.0-0 RC-10 (release candidate #10) With Live Electronics Tutorial.

Released november 7th 2023

Copyright © 2017-2023 Alexandre Torres Porres and others

This work is free. You can redistribute it and/or modify it under the terms of the Do What The Fuck You Want To Public License, Version 2, as published by Sam Hocevar. See License.txt

<https://github.com/porres/pd-else/blob/master/License.txt> and <http://www.wtfpl.net/> for more details

For details on authorship check the source code. Other licenses also apply for specific objects and this is also informed in the source code. For instance: - [beat~], [sfont~], [giga.rev~] are licensed under the GNU GPL library - [sfz~] and band limited oscillators like [bl.saw~] are licensed under the BSD 2-Clause library - [plaits~], [osc.format], [osc.parse] and [osc.route] are licensed under the MIT library

ELSE comes with a Live Electronics tutorial as part of its documentation written by Alexandre Torres Porres, this work is licensed under a Creative Common (CC) License.

For copies of the licenses and the terms, please check the 'license' subfolder.

About ELSE

This version of ELSE needs **Pd 0.54-1** or above.

ELSE is a big library of externals that extends the performance Pure Data (Pd) - Miller S. Puckette's realtime computer music environment (download Pd from: <http://msp.ucsd.edu/software.html>).

ELSE provides a cohesive system for computer music, it also serves as a basis for an Live Electronics Tutorial by the same author, yours truly, Alexandre Torres Porres. This library's repository resides at <https://github.com/porres/pd-else/>. This tutorial is also found as part of the download of the ELSE library. Look for the 'Live-Electronics-Tutorial' folder inside it and also check its README on how to install it.

ELSE is also part of PlugData by Timothy Schoen, which is a fork of Pd that loads as a standalone or VST with a revamped GUI. ELSE has received collaboration from Tim and others involved with PlugData and many objects have been included in ELSE just so they are supported in PlugData. See:

<https://github.com/timothyschoen/PlugData>

This project is still in an experimental phase (currently at a 'release candidate' phase), where changes

may occur and backwards compatibility is not guaranteed until a final and more stable release is available.

Downloading ELSE:

You can get ELSE from <https://github.com/porres/pd-else/releases> - where all releases are available, but ELSE is also found via Pd's external manager (In Pd, just go for Help => Find Externals and search for 'else'). In any case, you should download the folder to a place Pd automatically searches for, and the common place is the `~/Documents/Pd/externals` folder. Instructions on how to install and build ELSE are provided below.

Installing ELSE:

ELSE comes as a set of separate binaries and abstractions, so it works if you just add its folder to the path or use `[declare -path else]`. ELSE comes with a binary that you can use load via "Preferences => Startup" or with `[declare -lib else]`, but all that this does is print information of what version of ELSE you have when you open Pd. You can also just load the 'else' external for that same purpose, check its help file.

But it's important that you add ELSE's path in Preferences ==> Path, so it loads an object browser plugin!

It might still be important to stress this library runs in Pd Vanilla and is not compatible to forks like the long dead "Pd Extended" and its new reincarnations "Pd-L2ork/Purr Data". Nevertheless, ELSE is included in the PlugData fork --> <https://github.com/timothyschoen/PlugData>, and a port of ELSE to Purr Data was started some time ago and there's a chance it might evolve into full support, see --> <https://github.com/agraef/purr-data/tree/pd-else>.

Building ELSE for Pd Vanilla:

ELSE relies on the build system called "pd-lib-builder" by Katja Vetter (check the project in: <https://github.com/pure-data/pd-lib-builder>). PdLibBuilder tries to find the Pd source directory at several common locations, but when this fails, you have to specify the path yourself using the `pdincludepath` variable. Example (assuming the unpacked Pd package is in `~/pd-0.54-0`; for Windows/MinGW add

```
pdbinpath=~/pd-0.54-0/bin/ ):
```

```
make pdincludepath=~/pd-0.54-0/src/
```

Installing with pdlibbuilder

Go to the pd-else folder and use "objectmdir" to set an *absolute* path for your build, something like:

```
make install objectmdir=~/else-build
```

Then move it from there to your preferred install folder for Pd and add it to the path. Cross compiling is also possible with something like this

```
make CC=arm-linux-gnueabi-gcc target.arch=arm7l install objectsdir=~/_else-build
```

Installing sfont~, sfz~ and plaits~

For technical reasons these objects reside in their own subdirectories of the ELSE source directory, so a normal build as described above will skip them. You can install these separately and you can also check their subfolders for their own READMEs and instructions.

To install them with the rest of ELSE you can build from the toplevel source directory using the special 'sfont', 'sfz' and 'plaits' targets, such as:

```
make sfz plaits pdincludepath=~/_pd-0.54-0/src/
```

```
make sfz-install plaits-install objectsdir=~/_else-build
```

For sfont you should do the same but you also must run a script in the sfont subfolder to copy the needed dependencies, check its readme for more details.

More About ELSE

"**EL Locus Solus**" is run by yours truly, Alexandre Torres Porres, and it organizes cultural events/concerts and music technology courses (<http://alexandre-torres.wixsite.com/el-locus-solus>) where a Live Electronics tutorial is provided with examples in Pure Data for its courses. These have been recently translated and completely rewritten to english with plans of being accompanied by a book. The latest releases are available at: <https://github.com/porres/Live-Electronic-Music-Tutorial>. This tutorial solely depends on the ELSE library and is a great didactic companion to this library. Both the library and the tutorial are provided as a single download, directly via Pure Data or GitHub.

The examples from the first incarnation of this tutorial were first developed for the now abandoned Pd Extended, making extensive use of the existing objects available in Pd Extended's libraries. Even though Pd Extended had many externals, there was the need at some point for something "else" - thus, this library emerged with the goal of providing more objects to include missing functionalities in the Pd Ecosystem.

But the library grew to encompass functionalities found in other Pd objects/libraries from old Pd Extended as well, with a different design and more functionalities. This was done in order to remove ALL the dependencies of the didactic material from these other libraries - with the goal to rely on just a single library that's alive (in active development) instead of many projects that are now long gone abandoned or not receiving much attention. I'm also involved in maintaining Cyclone, a legacy library for Pd (see: <https://github.com/porres/pd-cyclone>). But ELSE also superseeds cyclone for the purposes of this didactic material. See below in this document a list of alternatives to Cyclone provided by ELSE.

The goal of ELSE also outgrew the didactic material as it now includes objects not necessarily depicted in the computer music examples. Moreover, even basic elements from Pd Vanilla are being redesigned into new objects. So that's it, ELSE is becoming a quite big library and keeps growing and growing.

ELSE has been in active development for over 5 years but it will still take a little while for it to stabilize into

a final version. For now, it's at a "Release Candidate" stage of development, where changes may occur and backwards compatibility is not guaranteed until a final release is available.

Acknowledgements

Flávio Luis Schiavoni helped me out in a few things when I first started coding and collaborated with the objects: [median~] and [keyboard].

I'd also like to thank my Cyclone buddies Derek Kwan and Matt Barber, cause I started learning how to code externals with them as part of the cyclone team. Other developers of cyclone need to be praised, like Czaja, the original author, as I did steal quite a bit from cyclone into ELSE. I'd like to give a special thanks for Matt Barber for developing the "magic" in cyclone that I'm using here and also collaborating to ELSE with the objects: [float2bits], [brown~], [gray~], [perlin~], [pink~] and [blip~].

Lucarda is an active tester and has helped countless times with compilation issues for windows and more. Seb shader is a tcl/tk master that helped me a lot with this (which I know next to nothing) and is responsible for the [keycode] object.

Albert Graef from Purr Data is working on a port of ELSE so it builds and runs on Purr Data (still experimental and a long way to go). He's also doing several valuable contributions to the code and being helpful in general in this process - check <https://github.com/agraef/purr-data/releases/tag/2.19.2+ELSE>.

Kudos and thanks to my buddy Esteban Viveros for helping with the compilation of ELSE for other systems as well as ELSE for Camomile and libpd projects, which opened the way for PlugData by Timothy Schoen, who's doing an amazing jaw dropping job with this project based on camomile that includes ELSE. Timothy has also helped me fix many ELSE related issues and coded first versions of some objects like the band limited oscillators. Other folks from the PlugData gang are being very helpful like Alex Mitchell and Amy. PlugData is a fork of Pd with a revamped GUI and comes with the ELSE library. See: <https://github.com/timothyschoen/PlugData>.

ALTERNATIVES TO CYCLONE

ELSE offers alternatives to objects from the Cyclone library (a library that clones objects from MAX/MSP). The objects that have no similar counterpart in ELSE (at least so far) are: anal / buddy / capture / capture~ / coll / cycle / decide / decode / frameaccum~ / framedelta~ / funbuff / funnel / flush / forward / histo / kink~ / linedrive / prob / match / maximum / minimum / mousefilter / next / offer / peak / prob / pv / spray / substitute / teeth~ / trough / universal / vectral~

But, here are some considerations: - maximum/minimum => [array max] [array_min](#) - for [capture~] you can use [print~] - for [kink~] you can use [function~](#) - [spike~] => [else/status~] + [else/detect~] => [threshold~] + [timer] - [anal] is usually used with [prob] for markov chains, but you can use [else/markov] instead - [teeth~] is just a comb reverberator which can be constructed with [else/ffdelay~] + [else/fbdelay~] - [forward] => just message boxes with ";" - [flush] => [poly] has a flush option, so does [else/voices] - for [coll], you can use [text] which miller considers is a better design, but it's simpler.

Alternatives:

- +=~ / [plusequals~] => else/add~

- operators >~ / <~ / %~ / etc => else/op~ => [expr~]
- bitwise operators (bitand~ / bitor~, etc) => [expr~]
- accum => else/add -
